

REFERENCE MAGNETS

Reference magnets generate a homogeneous magnetic field in an air gap. They are mainly used to calibrate sensors for the magnetic field strength H or the magnetic flux density B . For example Gaussmeters, Teslameters or field strength measuring coils (search coils) can be calibrated by using reference magnets.

• Reference Magnets VM 4

The transverse reference magnets VM 4 are available with different flux densities in a range from about 0.01 T to 1 T (0.1 kG to 10 kG).

An outstanding reference magnet in this product line is the VM 4 - 10 mm. It is designed for maximum accuracy and generates a flux density of 0.25 T in an air gap of 10 mm height. The homogeneity of the magnetic field in the air gap is so good that the calibration of the system can be carried out directly by a nuclear magnetic resonance (NMR) measurement.

The reference magnets VM 4 - 2 mm and VM 4 - 5 mm have tapered pole caps.

Reference Magnet VM 4

Reference magnets VM 4 are available from stock in the following configurations:

Model	Air gap height	Air gap diameter	Field strength H	Flux density B
VM 4 - 2 mm - 1 T	2 mm	20 mm	800 kA/m (10 kOe)	1 T (10 kG)
VM 4 - 5 mm - 0,5 T	5 mm	35 mm	400 kA/m (5 kOe)	0.5 T (5 kG)
VM 4 - 10 mm - 0,25 T	10 mm	50 mm	200 kA/m (2.5 kOe)	0.25 T (2.5 kG)

Other flux densities from about 0.01 T to 1 T (0.1 kG to 10 kG) are available on request but require longer lead times.

Length:	120 mm
Width:	80 mm
Height:	100 mm
Weight:	2.2 kg

The reference magnets VM 4 contain long-term stable permanent magnets with low temperature coefficients. They are delivered in storage boxes.

The flux densities and field strengths given in the table are approximate values. The exact values will be determined from a calibration shortly before delivery.

• Reference Magnets VM 6

Reference magnets VM 6 are suitable to calibrate axial probes. These can have a diameter up to 7.7 mm.

Especially the VM 6 - 0,23 T has an extraordinary good homogeneity for an axial reference magnet. So the field strength in the center of the acceptance can be given with an uncertainty of approximately 0.3 %.

Reference Magnet VM 6

Model	Axial acceptance	Field strength	Flux density
VM 6 - 0,08 T	7.7 mm	64 kA/m (0.8 kOe)	0.08 T (0.8 kG)
VM 6 - 0,23 T	7.7 mm	180 kA/m (2.3 kOe)	0.23 T (2.3 kG)

Diameter:	70 mm
Height:	45 mm
Weight:	0.88 kg

The reference magnets VM 6 contain long-term stable permanent magnets with low temperature coefficients. They are delivered in storage boxes.

The flux densities and field strengths given in the table are approximate values. The exact values will be determined from a calibration shortly before delivery.

A DAkkS calibration certificate, which documents the traceability of the calibration to national standards, is included with the purchase of a VM 4 or VM 6. Calibration is performed in our ISO/IEC 17025 accredited calibration laboratories. Regular recalibration is recommended and can also be performed by our laboratories.

To preserve the calibration accuracy over a long time we recommend observing the following precautions:

- Keep reference magnets away from magnetic fields.
- Do not insert magnetic or magnetizable parts, for example tools, into the air gap.
- Avoid magnetic pollution in the air gap.
- Store the reference magnets in a safe place and take them out only for the calibration of your measuring instruments.
- Do not expose the reference magnets to mechanical shock or extreme temperatures.

Due to continuous product improvements, specifications are subject to change without notice.
